10 Title: TRICYCLIC BENZAZEPINE VASOPRESSIN  
ANTAGONISTS

This case is a continuation-in-part of Serial  
No. 08/373,132, filed January 17, 1995.

1. Field of the Invention

15 This invention relates to new tricyclic non-  
peptide vasopressin antagonists which are useful in  
treating conditions where decreased vasopressin levels  
are desired, such as in congestive heart failure, in  
disease conditions with excess renal water reabsorption  
20 and in conditions with increased vascular resistance and  
coronary vasoconstriction.

2. Background of the Invention

Vasopressin is released from the posterior  
25 pituitary either in response to increased plasma  
osmolarity detected by brain osmoreceptors or decreased  
blood volume and blood pressure sensed by low-pressure  
volume receptors and arterial baroreceptors. The  
hormone exerts its action through two well defined  
30 receptor subtypes: vascular V<sub>1</sub> and renal epithelial V<sub>2</sub>  
receptors. Vasopressin-induced antidiuresis, mediated  
by renal epithelial V<sub>2</sub> receptors, helps to maintain  
normal plasma osmolarity, blood volume and blood  
pressure.

35 Vasopressin is involved in some cases of  
congestive heart failure where peripheral resistance is

increased. V<sub>1</sub> antagonists may decrease systemic vascular resistance, increase cardiac output and prevent vasopressin induced coronary vasoconstriction. Thus, in conditions with vasopressin induce increases in total peripheral resistance and altered local blood flow, V<sub>1</sub>-antagonists may be therapeutic agents. V<sub>1</sub> antagonists may decrease blood pressure, induced hypotensive effects and thus be therapeutically useful in treatment of some types of hypertension.

10           The blockage of V<sub>2</sub> receptors is useful in treating diseases characterized by excess renal reabsorption of free water. Antidiuresis is regulated by the hypothalamic release of vasopressin (antidiuretic hormone) which binds to specific receptors on renal  
15   collecting tubule cells. This binding stimulates adenylyl cyclase and promotes the cAMP-mediated incorporation of water pores into the luminal surface of these cells. V<sub>2</sub> antagonists may correct the fluid retention in congestive heart failure, liver cirrhosis,  
20   nephritic syndrome, central nervous system injuries, lung disease and hyponatremia.

Elevated vasopressin levels occur in congestive heart failure which is more common in older patients with chronic heart failure. In patients with  
25   hyponatremic congestive heart failure and elevated vasopressin levels, a V<sub>2</sub> antagonist may be beneficial in promoting free water excretion by antagonizing the action of antidiuretic hormone. On the basis of biochemical and pharmacological effects of the hormone,  
30   antagonists of vasopressin are expected to be therapeutically useful in the treatment and/or prevention of hypertension, cardiac insufficiency, coronary vasospasm, cardiac ischemia, renal vasospasm, liver cirrhosis, congestive heart failure, nephritic  
35   syndrome, brain edema, cerebral ischemia, cerebral

hemorrhage-stroke, thrombosis-bleeding and abnormal states of water retention.

15 antagonists suffer from a lack of oral activity and many of these peptides are not selective antagonists since they also exhibit partial agonist activity.

Premature birth can cause infant health problems and mortality and a key mediator in the mechanism of labor is the peptide hormone oxytocin. On  
35 the basis of the pharmacological action of oxytocin, antagonists of this hormone are useful in the prevention

of preterm labor, B.E. Evans et al., J. Med. Chem. 35,  
 3919(1992), J. Med. Chem., 36, 3993(1993) and references  
 therein. The compounds of this invention are  
 antagonists of the peptide hormone oxytocin and are  
 5 useful in the control of premature birth.

The present invention relates to novel  
 tricyclic derivatives which exhibit antagonist activity  
 at V<sub>1</sub> and/or V<sub>2</sub> receptors and exhibit in vivo  
 vasopressin antagonist activity. The compounds also  
 10 exhibit antagonist activity at oxytocin receptors.

Compounds of this invention may be prepared as shown in Scheme I by reaction of tricyclic derivatives of Formula 3a and 3b with a substituted or unsubstituted 6-nitropyridine-3-carbonyl chloride 4 to give the intermediates 5a and 5b. Reduction of the nitro group in intermediates 5a and 5b gives the 6-aminopyridine derivatives 6a and 6b. The reduction of the nitro group in intermediates 5a and 5b may be carried out under catalytic reduction conditions (hydrogen-Pd/C; Pd/C-hydrazine-ethanol) or under chemical reduction conditions (SnCl<sub>2</sub>-ethanol; Zn-acetic acid TiCl<sub>3</sub>) and related reduction conditions known in the art for converting a nitro group to an amino group. The conditions for conversion of the nitro group to the amino group are chosen on the basis of compatability with the preservation of other functional groups in the molecule.

Reaction of compounds of Formula 6a and 6b with aroyl chloride or related activated aryl carboxylic acids in solvents such as chloroform, dichloromethane, dioxane, tetrahydrofuran, toluene and the like in the presence of a tertiary base such as triethylamine and diisopropylethylamine or pyridine and the like, affords the compounds 8a and 8b which are vasopressin antagonists.

Reaction of tricyclic derivatives of Formula 6a and 6b with either a carbamoyl derivative 9 or a  
 5 isocyanate derivative 10 gives compounds (Scheme 2) of  
 formula 11a and 11b which are vasopressin antagonists of  
 Formula I wherein  $R^6$  is

Scheme 2

Reaction of tricyclic derivatives of Formula **6a** and **6b** with arylacetic acids, activated as the acid chlorides **12**, anhydrides, mixed anhydrides or activated  
 5 with known activating reagents, gives compounds **13a** and **13b** (Scheme 3).

Scheme 3

The compounds of Formula I wherein Y, A-B, Z, R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> are as defined and the Ar moiety of R<sup>3</sup> (-COAr) is

may be prepared, as shown in Scheme 4, by reacting an activated ester of the pyridine-3-carboxylic acid 14

with tricyclic derivatives 3a and 3b. The pyridine-3-carboxylic acids 14 may be activated by preparing the anhydride, a mixed anhydride or reacting with diethyl cyanophosphonate, *N,N*-carbonyldiimidazole or related peptide coupling reagents. Alternatively, the acid chloride derivatives 15 may be prepared from the acid derivatives 14 and oxalyl chloride or thionyl chloride in an inert solvent. The solvent is removed and the derivative reacted with 3a or 3b at 0°C to 25°C in dichloromethane as solvent and a tertiary amine such as triethylamine as a base. The activating reagent for the pyridine-3-carboxylic acids 14 is chosen on the basis of its compatibility with other substituent groups and the reactivity of the activated derivative toward the tricyclic derivatives 3a and 3b to give the vasopressin antagonists 16a and 16b.

Scheme 4

Alternatively, the compounds of Formula I wherein Y, A-B, Z, R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> are as defined and the Ar moiety of R<sup>3</sup> (-COAr) is

wherein  $R^6$  is the moiety

$-X-R^7$  and X is S, NH,  $NCH_3$

may be prepared as shown in Scheme 5 by first converting  
 5 tricyclic derivatives 3a and 3b into the intermediates  
17a and 17b and then reacting these intermediates with  
 potassium, sodium, or lithium anions ( $R^7-X^-$ ) to give the  
 products 16a and 16b. The symbol  $M^+$  is a metal cation  
 derived from reacting a compound  $HXR^7$  with a metal  
 10 hydride (sodium or potassium hydride, for example) or  
 LDA, n-butyl lithium, lithium bis(trimethylsilyl)amide  
 and the like.

The reaction of intermediates 17a and 17b with  
 the moieties  $R^7-NH_2$  and  $R^7-NHCH_3$  may also be carried  
 15 without first forming the corresponding anions. Thus,  
 heating intermediates 17a and 17b with excess  $R^7-NH_2$  or  
 $R^7-NHCH_3$  in an inert solvent or without solvent gives  
 the products 16a and 16b wherein X is NH or  $NCH_3$ .

## Scheme 5

-135-

Alternatively, the intermediates 17a and 17b may be converted to the more reactive fluoride derivatives 18a and 18b as shown in Scheme 6. Reaction of the fluoride intermediates 18a and 18b with amines  $\text{NH}_2\text{R}^7$  and

5  $\text{CH}_3\text{NHR}^7$  gives the 6-aminonicotinoyl derivatives 19a and 19b.

Scheme 6

As an alternative method for synthesis of compounds of this invention as depicted in Formula I wherein Y, A-B, D, E, F and Z are as previously  
 5 described and R<sup>3</sup> is

is the coupling of pyridinyl carboxylic acids 20 with the tricyclic derivatives 3a and 3b to give 21a and 21b.

The pyridine carboxylic acids are activated  
 10 for coupling by conversion to an acid chloride, bromide or anhydride or by first reacting with an activating reagent such as N,N-dicyclocarbodiimide, diethyl cyanophosphonate and related "peptide type" activating reagents. The method of activating the acids 20 for  
 15 coupling to the tricyclic derivatives 3a and 3b is chosen on the basis of compatibility with other substituent groups in the molecule. The method of choice is the conversion of the 3-pyridinyl carboxylic acids 20 to the corresponding 3-pyridinylcarbonyl  
 20 chlorides. The 3-pyridinylcarbonyl chlorides 22 may be prepared by standard procedures known in the art, such as reaction with thionyl chloride, oxalyl chloride and the like. The coupling reaction is carried out in solvents such as halogenated hydrocarbons, toluene,  
 25 xylene, tetrahydrofuran, or dioxane in the presence of pyridine or tertiary bases such as triethylamine and the like (Scheme 7). Alternatively, the 3-pyridinylcarbonyl chlorides 22, prepared from the carboxylic acids 20, may be reacted with derivatives 3a and 3b in  
 30 pyridine with or without 4-(dimethylamino)pyridine.

In general, when the 3-pyridinyl carboxylic acids 20 are activated with "peptide type" activating reagents, higher temperatures are required than when the 3-pyridinylcarbonyl chlorides are used.

Scheme 7

Scheme 8

The starting materials **3a** and **3b** in the foregoing Schemes 1-7 may be prepared as follows. In accordance with Scheme 8, alkylation of heterocycles of structural type **24** with an alkylating moiety such as **23** gives intermediates **25**. The heterocycle **24** may contain an  $\alpha$ -

carboxaldehyde function or an  $\alpha$ -carboxylic and/or ester function as shown in Scheme 8. Where the intermediate 25 ( $R^{15}=H$ ) contains an  $\alpha$ -carboxaldehyde group, hydrogenation with palladium-on-carbon gives reduction and ring closure in one step to give 29.

In derivatives 25 where  $R^{15}$  is an  $\alpha$ -carboxylic and/or an  $\alpha$ -carboxylic ester function, the intermediate amino acid derivative 27 is first isolated and then ring closed. The ring closure of derivatives 27 may be carried out by heating or by activation of the acid function (27: $R^{15}=H$ ) for ring closure. The cyclic lactams 28 are conveniently reduced with diborane or lithium aluminum hydride to give intermediates 29. Reaction of tricyclic derivatives 29 with aroyl chlorides ( $ArCOCl$ ), where Ar is as hereinbefore defined, gives diazepines 26.

Tricyclic derivatives of structural type 36 may be prepared as shown in Scheme 9. Formylation of 32 under known conditions in the literature, such as Vilsmeier formylation, gives intermediates 35 which on reduction and ring closure affords tricyclics 37.

Where the ring containing the symbol Z is a substituted or unsubstituted phenyl group, the procedure gives 4,5-dihydropyrrolo[1,2-a]-quinoxalines 36. These derivatives 36 and 37 may be reacted with aroyl chlorides ( $ArCOCl$ ) wherein Ar is as previously defined or with a substituted or unsubstituted 6-nitropyridine-3-carbonyl chloride or with a nitrogen protecting group, such as benzyloxycarbonyl chloride to give compounds 38 and 39. The compounds 38 and 39 may be reacted with chlorine, bromine or halogenating reagents such as N-chlorosuccinimide, N-bromosuccinimide and the like to give compounds 40 and 41 wherein  $R^{17}$  is a halogen atom. The derivatives 38 and 39 may be formylated and acetylated to give products 40 and 41 wherein  $R^{17}$  is a

CHO or a -COCH<sub>3</sub> group. Halogenation, formylation and acetylation of derivatives 36 gives 1-substituted 4,5-dihydropyrrolo[1,2-a]quinoxalines. The derivatives 38, 39, 40 and 41 wherein R<sup>16</sup> is a substituted or unsubstituted 6-nitro-3-pyridinylcarbonyl group are reduced to give the 6-amino-3-pyridinylcarbonyl derivatives 42d and 43d which are reacted with reagents Ar'COCl, Ar'CH<sub>2</sub>COCl or

10 wherein Ar' and R<sub>b</sub> are as previously hereinbefore defined, to give tricyclic diazepines 44 and 45.

A mixture of thionyl chloride (100 ml) and 6-[(5-fluoro-2-methylbenzoyl)amino]pyridine-3-carboxylic  
20 acid (2.7 g, 10 mmol) is heated to reflux for 5 hours. At the end, excess thionyl chloride is removed and the acid chloride is dissolved in  $CH_2Cl_2$  (100 ml). At room temperature, the methylene chloride solution of the 6-[(5-fluoro-2-methylbenzoyl)amino]pyridine-3-carbonyl  
25 chloride is added slowly. The reaction mixture is stirred at room temperature for 2 hours and quenched with ice cold water. The reaction mixture is washed with 0.1 N NaOH and subsequently washed with water. The  $CH_2Cl_2$  layer is separated; dried ( $MgSO_4$ ), filtered and  
30 concentrated. The product is purified by silica gel column chromatography by eluting first with 10% ethyl acetate-hexane (1 L) and then with 30% ethyl acetate-hexane. The product is crystallized from ethyl acetate-hexane. Yield 1.0 g, 46 ; mass spectrum (FAB),  $M^+1$  441;  
35  $M^+Na$ : 462.

Platelet Source: Hudson Valley Blood Services, Westchester Medical Center, Valhalla, NY.

Platelet Membrane Preparation:

Frozen platelet rich plasma (PRP), received from the Hudson Valley Blood Services, are thawed to room temperature. The tubes containing the PRP are centrifuged at 16,000 x g for 10 min. at 4°C and the supernatant fluid discarded. The platelets resuspended in an equal volume of 50.0 mM Tris.HCl, pH 7.5 containing 120 mM NaCl and 20.0 mM EDTA. The suspension is recentrifuged at 16,000 x g for 10 min. This washing step is repeated one more time. The wash discarded and the lysed pellets homogenized in low ionic strength buffer of Tris.HCl, 5.0 mM, pH 7.5 containing 5.0 mM EDTA. The homogenate is centrifuged at 39,000 x g for 10 min. The resulting pellet is resuspended in Tris.HCl buffer, 70.0 mM, pH 7.5 and recentrifuged at 39,000 x g for 10 min. The final pellet is resuspended in 50.0 mM

5     Binding to Vasopressin V<sub>1</sub> receptor subtype in Human Platelet Membranes:

10         In wells of 96 well format microtiter plate, add 100 µl of 50.0 mM Tris.HCl buffer containing 0.2% BSA and a mixture of protease inhibitors (aprotinin, leupeptin etc.). Then add 20 µl of [<sup>3</sup>H]Ligand (Manning or Arg<sup>8</sup>Vasopressin), to give final concentrations ranging from 0.01 to 10.0 nM. Initiate the binding by adding 80.0 µl of platelet suspension (approx. 100 µg protein). Mix all reagents by pipetting the mixture up and down a few times. Non specific binding is measured in the presence of 1.0 µM of unlabeled ligand (Manning or Arg<sup>8</sup>Vasopressin). Let the mixture stand undisturbed at room temperature for ninety (90) min. Upon this time, rapidly filter off the incubate under vacuum suction over GF/B filters, using a Brandel® Harvester. Determine the radioactivity caught on the filter disks by the addition of liquid scintillant and counting in a liquid scintillator.

#### Oxytocin Receptor Binding

##### (a) Membrane Preparation

Female Sprague-Dawley rats weighing approximately 200-250 g are injected intramuscularly (i.m.) with 0.3 mg/kg of body weight of diethylstilbestrol (DES). The rats are sacrificed 18 hours later under pentobarbital anesthesia. The uteri are dissected out, cleaned of fat and connective tissues and rinsed in 50 ml of normal saline. The tissue pooled from six rats is homogenized in 50 ml of 0.01 mM Tris.HCl, containing 0.5 mM dithiothreitol and 1.0 mM EDTA, adjusted to pH 7.4, using a polytron at setting 6 with three passes of 10 sec each. The homogenate is passed through two (2) layers of cheesecloth and the filtrate centrifuged at 1000 x g for 10 min. The clear supernatant is removed and recentrifuged at 165,000 x g for 30 min. The resulting pellet containing the oxytocin receptors is resuspended in 50.0 mM Tris.HCl containing 5.0 mM MgCl<sub>2</sub> at pH 7.4, to give a protein concentration of 2.5 mg/ml of tissue suspension. This preparation is used in subsequent binding assays with [<sup>3</sup>H]Oxytocin.

##### (b) Radioligand Binding

Binding of 3,5-[<sup>3</sup>H]Oxytocin ([<sup>3</sup>H]OT) to its receptors is done in microtiter plates using [<sup>3</sup>H]OT, at various concentrations, in an assay buffer of 50.0 mM Tris.HCl, pH 7.4 and containing 5.0 mM MgCl<sub>2</sub>, and a mixture of protease inhibitors: BSA, 0.1 mg; aprotinin, 1.0 mg; 1,10-phenanthroline, 2.0 mg; trypsin, 10.0 mg; and PMSF, 0.3 mg per 100 ml of buffer solution. Non-specific binding is determined in the presence of 1.0 μM unlabeled OT. The binding reaction is terminated after 60 min., at 22°C, by rapid filtration through glass fiber filters using a Brandel® cell harvester (Bio-medical Research and Development Laboratories, Inc.,

Gaithersburg, MD). Competition experiments are conducted at equilibrium using 1.0 nM [ $^3\text{H}$ ]OT and varying the concentration of the displacing agents. The concentrations of agent displacing 50% of [ $^3\text{H}$ ]OT at its sites ( $\text{IC}_{50}$ ) are calculated by a computer assisted LUNDON-2 program (LUNDON SOFTWARE INC., Ohio, USA).

The results of this assay on representative examples are shown in Table 4.

When the compounds are employed for the above utility, they may be combined with one or more pharmaceutically acceptable carriers, for example, solvents, diluents and the like, and may be administered orally in such forms as tablets, capsules, dispersible powders, granules, or suspensions containing, for example, from about 0.05 to 5% of suspending agent, syrups containing, for example, from about 10 to 50% of sugar, and elixirs containing, for example, from about 20 to 50% ethanol, and the like, or parenterally in the form of sterile injectable solution or suspension containing from about 0.05 to 5% suspending agent in an isotonic medium. Such pharmaceutical preparations may contain, for example, from about 0.05 up to about 90% of the active ingredient in combination with the carrier, more usually between about 5% and 60% by weight.

The effective dosage of active ingredient employed may vary depending on the particular compound employed, the mode of administration and the severity of the condition being treated. However, in general, satisfactory results are obtained when the compounds of the invention are administered at a daily dosage of from about 0.5 to about 500 mg/kg of animal body weight, preferably given in divided doses two to four times a day, or in sustained release form. For most large mammals the total daily dosage is from about 1 to 100 mg, preferably from about 2 to 80 mg. Dosage forms

suitable for internal use comprise from about 0.5 to 500 mg of the active compound in intimate admixture with a solid or liquid pharmaceutically acceptable carrier. This dosage regimen may be adjusted to provide the optimal therapeutic response. For example, several divided doses may be administered daily or the dose may be proportionally reduced as indicated by the exigencies of the therapeutic situation.

These active compounds may be administered orally as well as by intravenous, intramuscular, or subcutaneous routes. Solid carriers include starch, lactose, dicalcium phosphate, microcrystalline cellulose, sucrose and kaolin, while liquid carriers include sterile water, polyethylene glycols, non-ionic surfactants and edible oils such as corn, peanut and sesame oils, as are appropriate to the nature of the active ingredient and the particular form of administration desired. Adjuvants customarily employed in the preparation of pharmaceutical compositions may be advantageously included, such as flavoring agents, coloring agents, preserving agents, and antioxidants, for example, vitamin E, ascorbic acid, BHT and BHA.

The preferred pharmaceutical compositions from the standpoint of ease of preparation and administration are solid compositions, particularly tablets and hard-filled or liquid-filled capsules. Oral administration of the compounds is preferred.

These active compounds may also be administered parenterally or intraperitoneally. Solutions or suspensions of these active compounds as a free base or pharmacologically acceptable salt can be prepared in water suitably mixed with a surfactant such as hydroxypropylcellulose. Dispersions can also be prepared in glycerol, liquid polyethylene glycols and mixtures thereof in oils. Under ordinary conditions of storage

and use, these preparation contain a preservative to prevent the growth of microorganisms.

5           The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and must be fluid to the extent that easy syringability exists. 10 It must be stable under the conditions of manufacture and storage and must be preserved against the contaminating action of microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol 15 (e.g., glycerol, propylene glycol and liquid polyethylene glycol), suitable mixtures thereof, and vegetable oils.

Effects on the Antagonism of Endogenous Arginine  
Vasopressin Antidiuretic (V<sub>2</sub>) Response in Conscious Rats  
with Free Access to Water Drinking Before but not During  
the Experiment:

Male or female normotensive Sprague-Dawley rats  
(Charles River Laboratories, Inc., Kingston, NY) of 400-  
450 g body weight were supplied with Laboratory Rodent  
Feed #5001 (PMI Feeds, Inc., Richmond, IN) and water ad  
libitum. On the day of test, rats were placed indivi-  
dually into metabolic cages equipped with stainless  
steel screens (to separate the feces from the urine) and  
funnels for collection of urine. Vehicle or reference  
agent was given at various oral doses. During the test,  
rats were not provided with water or food. Urine was  
collected for four hours after dosing of the test  
compound. At the end of four hours, urine volume was  
measured. Urinary osmolality was determined using a  
Fiske One-Ten Osmometer (Fiske Associates, Norwood, MA  
02062) or an Advanced CRYOMATIC Osmometer, Model 3C2  
(Advanced Instruments, Norwood, MA). Determinations of  
Na<sup>+</sup>, K<sup>+</sup> and Cl<sup>-</sup> ion were carried out using ion specific  
electrodes in a Beckman SYNCHRON EL-ISE Electrolyte  
System analyzer. In the following results, increased  
urine volume and decreased osmolality relative to AVP-  
control indicates activity. The results of this test on  
representative compounds of this invention are shown in  
Table 5.

20      The compounds of the present invention can be  
used in the form of salts derived from pharmaceutically  
or physiologically acceptable acids or bases. These  
salts include, but are not limited to, the following:  
salts with inorganic acids such as hydrochloric acid,  
sulfuric acid, nitric acid, phosphoric acid and, as the  
25      case may be, such organic acids as acetic acid, oxalic  
acid, succinic acid, and maleic acid. Other salts  
include salts with alkali metals or alkaline earth  
metals, such as sodium, potassium, calcium or magnesium  
or with organic bases. The compounds can also be used  
30      in the form of esters, carbamates and other conventional  
"pro-drug" forms, which, when administered in such form,  
convert to the active moiety *in vivo*.

35      When the compounds are employed for the above  
utilities, they may be combined with one or more  
pharmaceutically acceptable carriers, for example, sol-  
vents, diluents and the like, and may be administered  
orally in such forms as tablets, capsules, dispersible

powders, granules, or suspensions containing, for example, from about 0.05 to 5% of suspending agent, syrups containing, for example, from about 10 to 50% of sugar, and elixirs containing, for example, from about 20 to 50% ethanol, and the like, or parenterally in the form of sterile injectable solutions or suspensions containing from about 0.05 to 5% suspending agent in an isotonic medium. Such pharmaceutical preparations may contain, for example, from about 25 to about 90% of the active ingredient in combination with the carrier, more usually between about 5% and 60% by weight.

The effective dosage of active ingredient employed may vary depending on the particular compound employed, the mode of administration and the severity of the condition being treated. However, in general, satisfactory results are obtained when the compounds of the invention are administered at a daily dosage of from about 0.5 to about 500 mg/kg of animal body weight, preferably given in divided doses two to four times a day, or in a sustained release form. For most large mammals the total daily dosage is from about 1 to 100 mg, preferably from about 2 to 80 mg. Dosage forms suitable for internal use comprise from about 0.5 to 500 mg of the active compound in intimate admixture with a solid or liquid pharmaceutically acceptable carrier. This dosage regimen may be adjusted to provide the optimal therapeutic response. For example, several divided doses may be administered daily or the dose may be proportionally reduced as indicated by the exigencies of the therapeutic situation.

These active compounds may be administered orally as well as by intravenous, intramuscular, or subcutaneous routes. Solid carriers include starch, lactose, dicalcium phosphate, microcrystalline cellulose, sucrose and kaolin, while liquid carriers include sterile water, polyethylene glycols, non-ionic surfac-

5           tants and edible oils such as corn, peanut and sesame  
oils, as are appropriate to the nature of the active in-  
gredient and the particular form of administration de-  
sired. Adjuvants customarily employed in the prepara-  
tion of pharmaceutical compositions may be advan-  
tageously included, such as flavoring agents, coloring  
agents, preserving agents, and antioxidants, for  
example, vitamin E, ascorbic acid, BHT and BHA.

10           The preferred pharmaceutical compositions from  
the standpoint of ease of preparation and administration  
are solid compositions, particularly tablets and hard-  
filled or liquid-filled capsules. Oral administration  
of the compounds is preferred.

15           These active compounds may also be adminis-  
tered parenterally or intraperitoneally. Solutions or  
suspensions of these active compounds as a free base or  
pharmacologically acceptable salt can be prepared in  
water suitably mixed with a surfactant such as hydrox-  
20 ypropylcellulose. Dispersions can also be prepared in  
glycerol, liquid, polyethylene glycols and mixtures  
thereof in oils. Under ordinary conditions of storage  
and use, these preparations contain a preservative to  
prevent the growth of microorganisms.

25           The pharmaceutical forms suitable for in-  
jectable use include sterile aqueous solutions or dis-  
persions and sterile powders for the extemporaneous  
preparation of sterile injectable solutions or disper-  
sions. In all cases, the form must be sterile and must  
30 be fluid to the extent that easy syringability exists.  
It must be stable under conditions of manufacture and  
storage and must be preserved against the contaminating  
action of microorganisms such as bacterial and fungi.  
The carrier can be a solvent or dispersion medium con-  
35 taining, for example, water, ethanol (e.g., glycerol,  
propylene glycol and liquid polyethylene glycol),  
suitable mixtures thereof, and vegetable oil.

5           The new tricyclic non-peptide vasopressin antagonists of this invention are useful in treating conditions where decreased vasopressin levels are desired, such as in congestive heart failure, in disease conditions with excess renal water reabsorption and in conditions with increased vascular resistance and coronary vasoconstriction.

10           In particular, the vasopressin antagonists of this invention are therapeutically useful in the treatment and/or prevention of hypertension, cardiac insufficiency, coronary vasospasm, cardiac ischemia, renal vasospasm, liver cirrhosis, congestive heart failure, nephritic syndrome, brain edema, cerebral  
15           ischemia, cerebral hemorrhage-stroke, thrombosis-bleeding and abnormal states of water retention.

20           In particular, the oxytocin antagonists of this invention are useful in the prevention of preterm labor and premature birth which is a significant cause of infant health problems and infant mortality.
